

# All About a frog

23/6/08

Frogs live in and out of water. They have an unusual life cycle and they are amphibians. Frogs look different in the beginning than in the end of their lives.

## Frogspawn

The female frog lays the eggs in the water. The eggs look like clear jelly with a black dot in the middle. This is called frogspawn.

## Tadpoles

The little black dot begins to turn into a tadpole. First it grows a tail and gills to breathe under water. Their gills help them take oxygen out of the water. Then they eat and push their way out of the egg. The tadpoles now look like little black fish.
